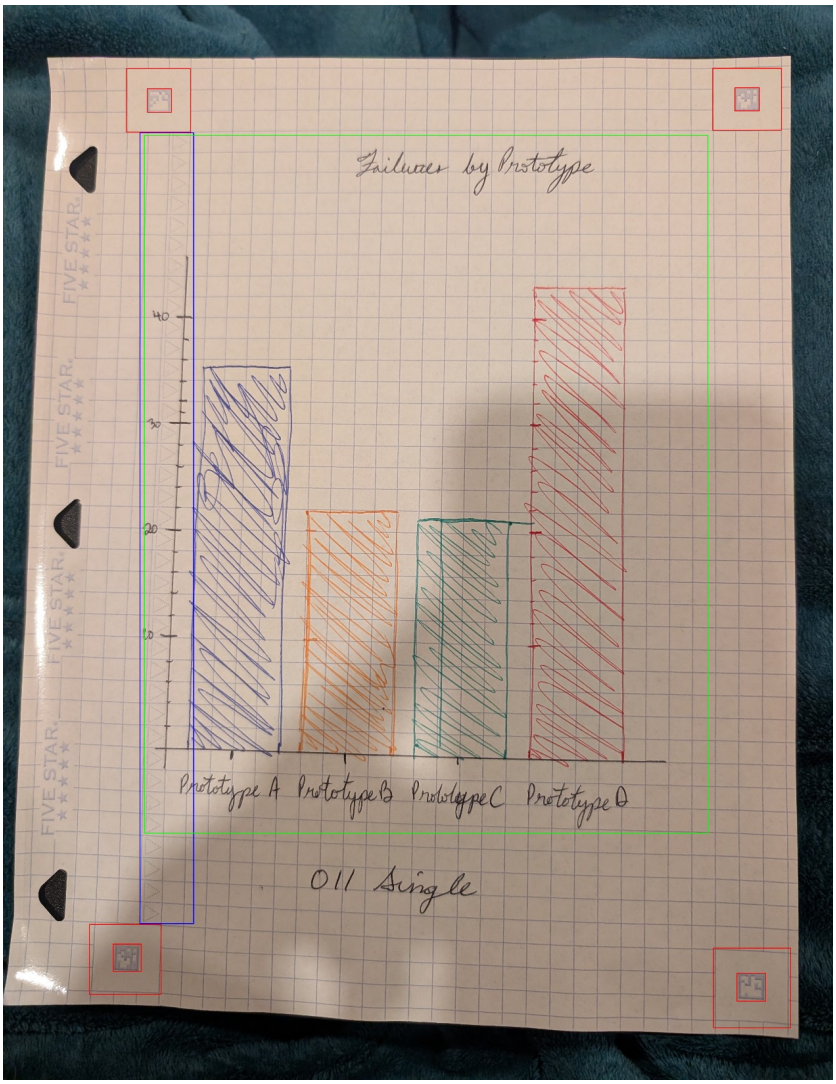
FieldChartOCR: Extraction of Handwritten Charts and Tables



Project Proposal by: Chris Brechin

Prepared for: DTSA-5506

Date: November 18th, 2025

0. Abstract

Handwritten charts and technical notes are rich with quantitative insight yet remain locked inside scanned pages. FieldChartOCR extends ChartOCR to converting hand-drawn charts and tables into structured datasets. The procedure goes through chart classification, element detection, and handwriting OCR, to information extraction. The focus is on delivering a practical tool that field technicians and researchers can rely on without exhaustive manual transcription.

1. Introduction

Digitizing handwritten technical notebooks is labour-intensive. Engineers, students, and analysts rely on annotations, sketches, and mixed layouts that resist automated extraction. Existing OCR tools, like ChartOCR, provide plain text at best; they ignore hand-drawn informatics in order to optimize accuracy. On the other hand, professionals (such as field technicians) must manually re-create charts in tools such as Excel, Desmos, or CAD systems—a significant barrier to iteration and collaboration.

The goal of FieldChartOCR is to build a unified pipeline that ingests handwritten graphs, tables, and mechanical annotations and produces structured artifacts suitable for analytics and visualization. By coupling deep learning with rule-based reasoning, I hope to generalize across chart families while maintaining transparency in intermediate outputs. Delivering this capability advances document understanding, accelerates knowledge sharing, and supports accessibility by providing machine-readable alternatives to complex figures.

2. Related Work

- **Chart Understanding Frameworks:** ChartOCR's hybrid keypoint-and-rule architecture demonstrates the effectiveness of combining deep detection with domain logic. ChartSense and ReVision apply rule-based heuristics but struggle with diverse layouts. DVQA and FigureQA focus on question answering but assume neatly rendered charts.
- **Diagram & Table Recognition:** DiagramParseNet and other graph-parsing models detect nodes and edges in structured diagrams. DeepDeSRT and PubTabNet handle printed tables yet rely on sharp lines and consistent fonts, unlike the irregular strokes in hand-drawn notes.
- **Handwriting OCR & Math Recognition:** Transformer-based handwriting recognizers and MathOCR systems convert cursive and symbolic notation into LaTeX. They typically operate on grayscale inputs and overlook complex layouts.
- **Document Normalization & Imaging:** Research on illumination correction and phase-based representations inspires our preprocessing layer. Multispectral imaging studies inform our roadmap for future sensing modalities.

3. Proposed Work

3.1 Data Sources

- handwritten bar chart diagrams
- synthesized datasets in comma separated lists
- bar charts generated with `matplotlib`

3.2 System Architecture

1. **Preprocessing & Layout Normalization**
    - Perform denoising, skew correction, grid suppression, and edge enhancement tailored to notebook paper.
    - Standardize contrast and dynamic range to support downstream detectors.
    - **Note:** I may move to scanning the images if this part proves too onerous.
2. **Chart Type Classification**
    - Lightweight CNN-transformer hybrid predicts dominant chart categories for each region.
        - The goal is to match the 3 charts recognized by ChartOCR: bar charts, line charts, and pie charts.
    - Supports mixed-content pages by assigning probabilities per region.
3. **Element Identification & OCR**
    - Shared detection backbone with heads for axes, scales, titles, data marks, and table structure.
4. **Semantic Assembly & Output**
    - Associates text blocks with detected elements, enforces basic geometric constraints, and exports Markdown summaries plus CSV datasets.

3.3 Development Plan

- **Phase 1:** Build preprocessing pipeline, layout normalization, and table-to-CSV baseline.
- **Phase 2:** Train chart classifier and core element detectors; integrate handwriting OCR.
- **Phase 3:** Finalize semantic assembly, polish outputs, and iterate on error analysis.

4. Evaluation Plan

- **Effectiveness Metrics**
  - Chart classification macro-F1 across core categories (bar, line, scatter, tables).
  - Element detection precision/recall for axes, titles, and data marks.
  - OCR character error rate (CER) and table reconstruction F1.
- **Efficiency Metrics**
  - End-to-end runtime per page and memory footprint.
- **Experimental Setup**
  - Stratified train/validation/test split by chart type and handwriting style.
  - Baselines: ChartOCR, generic OCR plus heuristic extraction, and manual transcription samples.
  - Ablations on preprocessing and semantic assembly.

5. Timeline & Milestones

Phase	Milestone
1	Finalize annotation schema, label initial dataset.
2	**Implement normalization prototype, integrate baseline handwriting OCR and chart classifier; evaluate on sample pages. (CURRENT)**
3	Deploy element detectors and table recognizer; stand up Markdown/CSV writers.
4	Iterate on semantic assembly, run core evaluations, and prepare presentation materials.

Current progress: synthesized dataset, building dataset for QC square recognition using GIMP commandline.

6. Risks and Mitigation

- **Limited Hand-Drawn Training Data**
  - Mitigation: remove the information extraction steps and keep only the classification.
- **Complex Page Layouts**
  - Mitigation: flag difficult cases for human review.
- **Lighting Noise**
  - Mitigation: use normalization targets, augment brightness/contrast, and monitor detector confidence.

7. Conclusion and Future Work

Currently, FieldChartOCR is stuck in the early stages of OCR work. The page corner detection requires more fine-tuning to become robust. On an ideal sample photo, 4 corners are detected and the image can be cropped. However, average case scenarios where 1 or more corners are not detected proves difficult to remedy. I am improving the corner detection function by augmenting samples of the QC squares with computer-edited samples.

A1 Bar Chart Examples

In [1]:
```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
```

Palette

For uniformity in hand-drawing and barcharts, I have selected a colour-palette that resembles the pens that I have purchased for this endeavor

In [2]:
```
# Define palette for grouped bar charts
grouped_palette = [
    '#1f77b4',  # Blue
    '#ff7f0e',  # Orange
    '#2ca02c',  # Green
    '#d62728',  # Red
    '#9467bd',  # Purple
    '#555555',  # Grey
    '#e377c2',  # Pink
    '#2495C4',  # Light Blue
]

# Visualise the palette

plt.figure(figsize=(10, 1))
plt.bar(range(len(grouped_palette)), [1]*len(grouped_palette), color=grouped_palett
# Add labels to the bars
for i, color in enumerate(grouped_palette):
    plt.text(i, 0.5, color, ha='center', va='center', fontsize=10)
# Remove the y-axis labels
plt.yticks([])
# Remove the x-axis labels
plt.xticks([])
# Remove the plot outline
plt.gca().spines['top'].set_visible(False)
plt.gca().spines['right'].set_visible(False)
plt.gca().spines['bottom'].set_visible(False)
plt.gca().spines['left'].set_visible(False)
plt.show()
```

016 Grouped

In [3]:
```
# 1. Simple Bar Chart Example
bc_016_grouped = pd.read_csv('./bar_charts/bar_grouped_016.csv')

bc_016_grouped
```

Out[3]:

	Group	Subgroup	Value
0	Section 1	Circle	13

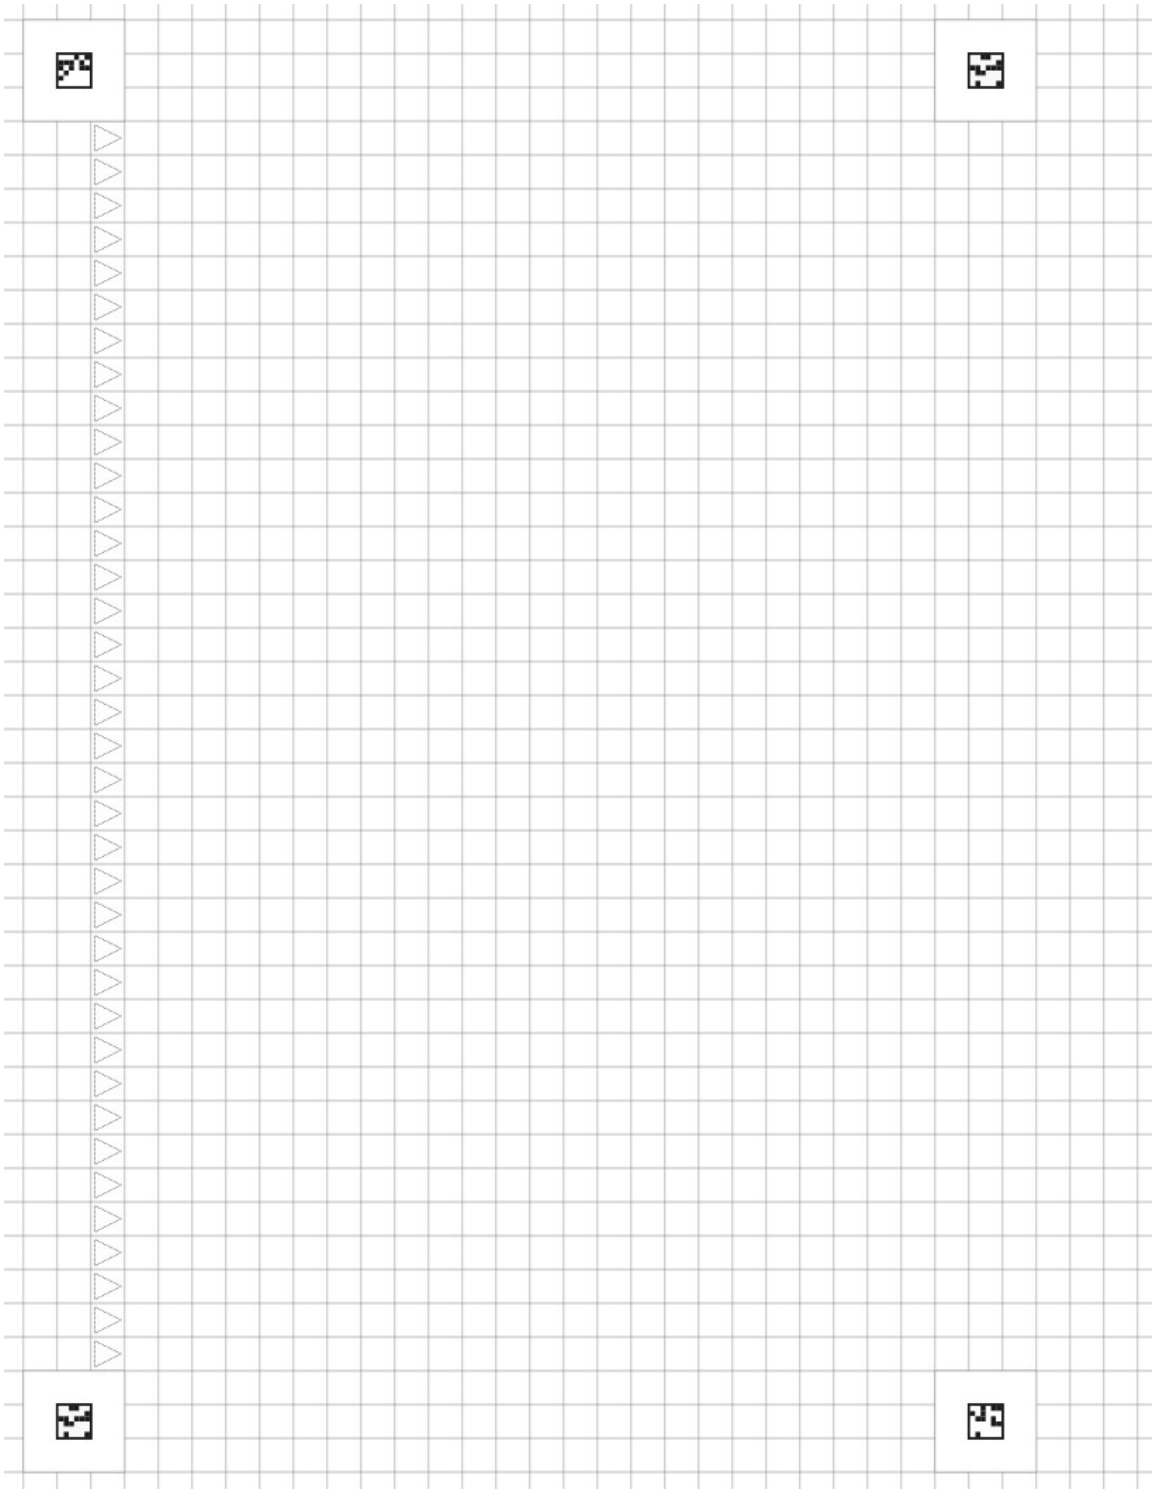
A2 Image Normalization

Each image that is taken with the camera phone will need to be normalized.

In [4]:
```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
```

Page Zero Display



Page One Display

Calibration Page One Display

Other Page Variants

Now that the calibration cubes have been assessed, we turn our attention to another form of

noise.

- Dot Matrix
- Lined
- Blank
- Hex

Thoughts

It is not lost on me that there is an infinite amount of paper types that one could imagine in order to convey ideas. Personally, the type for which I am the most nostalgic is dot matrix. An example below:

Dot Matrix Page One

Describing the Calibration Features

Quick Calibration Squares: `6 x 6` square in every corner. Each cell in the square is `0.975mm+/- 0.500mm` wide. There are 4 distinct styles:

- Top Left and Bottom Right QC square are the same per page (Page 0: Rear; Page 1; Front)
  - see:
    - Page Zero and One Bottom Right
    - Page Zero and One Top Left
- The Top Right and Bottom Left of each page is the same
  - see:
    - Page Zero Top Right and Bottom Left
    - Page One Top Right and Bottom Left

QC Square Envelope: Each QC square has an evelope around it (as seen in any appended images of the sqaures). The envelope is `0.75in`.

Left Margin Arrows Each page has directional triangles in a straight line along the Left Margin of the drawing area. There are `37` of them pointing with the tips towards the drawing area. The ratio of the triangle is such that the left edge, which is perpendicular to the column direction is `0.75in - 2mm` and the two other edges, which are congruent, are also `0.75in - 2mm`. The triangles are centered within each cell within each column and row.

Left Margin

Matrix Representations of QC Squares

Visual Representation

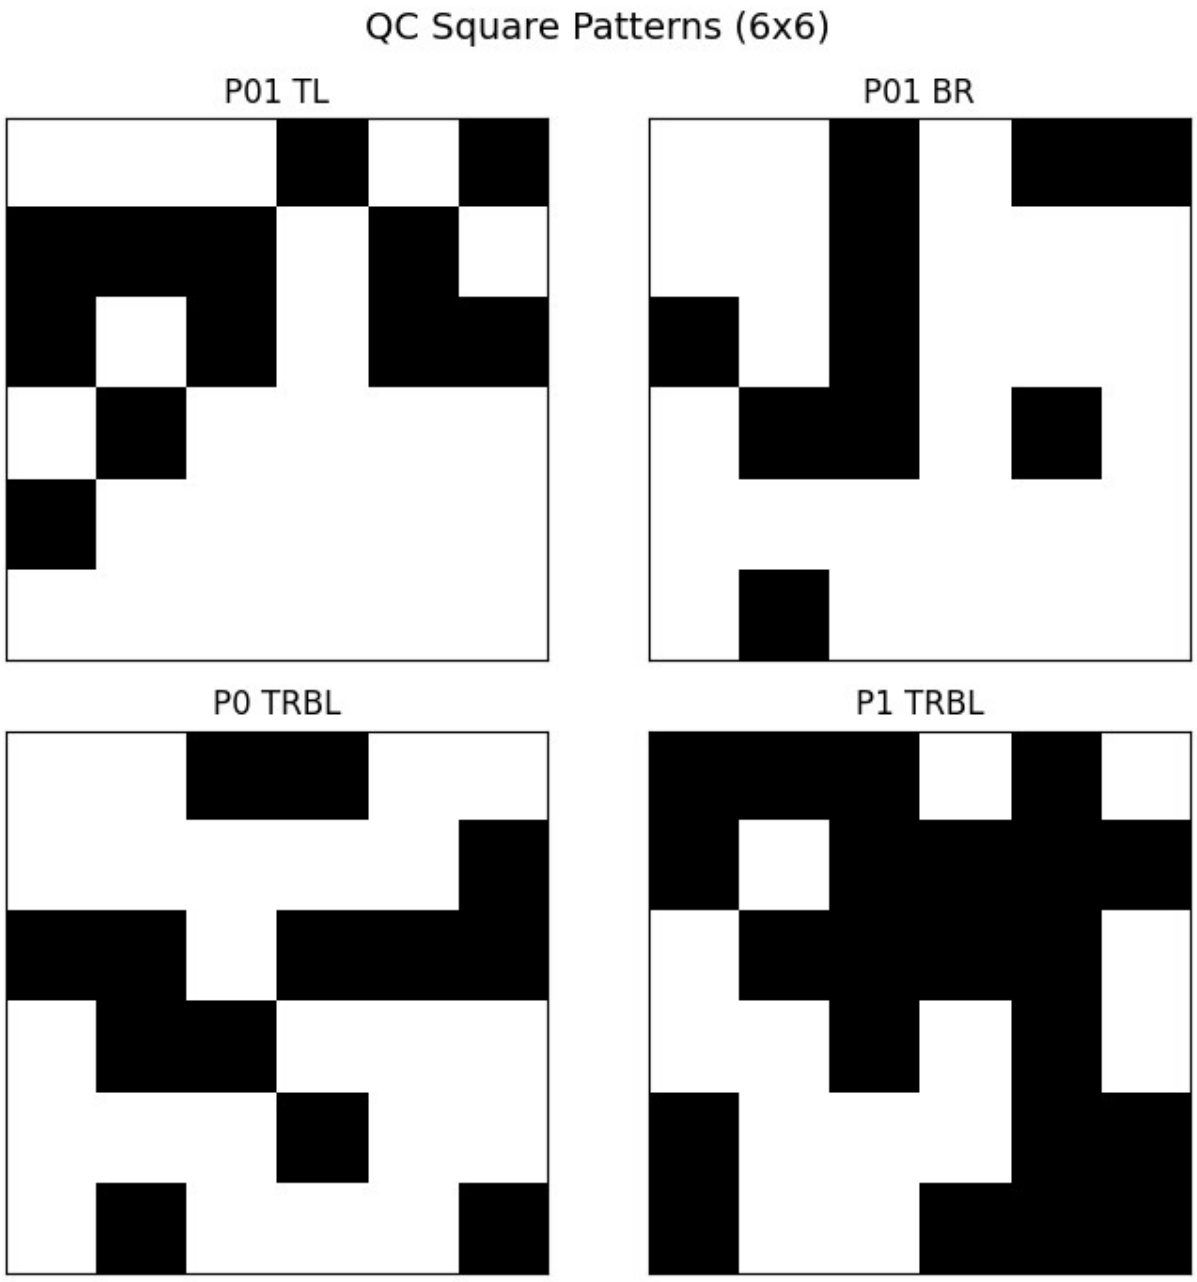
In [6]:
```
import matplotlib.pyplot as plt

# Show graph of what the QC squares look like

qc_patterns = {
    'p01_tl': np.array(p01_tl),
    'p01_br': np.array(p01_br),
    'p0_trbl': np.array(p0_trbl),
    'p1_trbl': np.array(p1_trbl)
}

fig, axes = plt.subplots(2, 2, figsize=(7, 7))
for ax, (name, pattern) in zip(axes.flatten(), qc_patterns.items()):
    ax.imshow(pattern, cmap='gray', vmin=0, vmax=1, interpolation='nearest')
    ax.set_title(name.replace('_', ' ').upper())
    ax.set_xticks([])
    ax.set_yticks([])
    ax.grid(False)

plt.suptitle('QC Square Patterns (6x6)', fontsize=14)
plt.tight_layout()
plt.show()
```



Thought

I do not approve of the imperial system, but then I didn't make the paper. In future work, I would prefer a metric version of the medium. This is something that I think would take no longer than 30 minutes to design.

Normalization Script

Test Image

Degenerate points

points that do not form a valid geometric shape; they are collinear, overlapping, or not distinct enough to define a proper quadrilateral for transformations.

```

In [8]:
```
def detect_qc_square(image, corner='auto', search_region_size=0.2, min_square_area=
    """
    Detect QC square in the image.
```

```
    Parameters:
    -----------
    image : numpy.ndarray
        RGB image (H, W, 3) or BGR if from cv2.imread
    corner : str, optional
        Which corner to search: 'tl', 'tr', 'bl', 'br', or 'auto' (search all)
        Default: 'auto'
    search_region_size : float
        Fraction of image dimensions to search in corner (0.0-1.0)
        Default: 0.2 (top/bottom/left/right 20%)
    min_square_area : int
        Minimum area for detected square (in pixels)
        Default: 100

    Returns:
    --------
    dict or list of dicts
        If corner='auto': list of dicts, one per detected QC square
        Otherwise: single dict with keys:
            - 'bbox': (x, y, width, height) bounding box
            - 'corner': detected corner position ('tl', 'tr', 'bl', 'br')
            - 'pattern': extracted 6x6 pattern (numpy array)
            - 'pattern_match': matched pattern name (if successful)
            - 'confidence': match confidence (0-1)

Music Theory Workbook

Level 0

0. Colour over the Whitespace then Put Stcker over these instructons

12/5/2025

Instruments: Piano, Bass, 6-String Guitar

480c34a3-b388-4685-a642-728a08bf24f8

1. Draw the popsicle stcks (**1 octave**) (/8)

2. Draw the popsicle stcks again (**2 octaves**) (/16)

3. *For a challenge:* Draw some popsicle stcks again (**with only 4 keys**) (/4)

4. Draw the popsicle stcks again (**with the "frst" key labelled**) (/1)

5. *For fun:* Draw the popsicle stcks again (**from 'C' to 'E', colour in the <u>half-tones only</u>**) (--/0)

---

6. What is the actual name of these popsicle stcks? *Hint Below:*

frst listed instrument

Answer: _____ (/1)

7. The guitar belongs to the _____ family, where sound comes from vibratng strings, making it a core member of the plucked string family alongside the banjo, lute, and harp. (/4)

8. Statement: “The guitar and the piano belong to the same family.”

Is that [True], or [False]? (/1)

9. Why are the ____ useful to use even though they are not on the _____ ? *Hints Below:*

[popsicles, Queston 7] (/2)

Answer: _____ (/2)

10. Statement: “I wanted to learn a song is not a good enough reason for learning the guitar.”

Is that [True], or [False]? (/1)

11. Rewrite this in order (**start from ‘C’**) (/12)

A B D F G E C

12. Rewrite this in order (**start from ‘E’**) (/12)

B A G F D C E

13. Why does a string make a noise?

Answer: _____ (/4)

14. What are two half-tones called?

Answer: _____ (/4)

15. Which keys do not black keys between them?

Answers: The pairs _____ and _____ (/2)

16. What are the 3 knobs are your electric guitar for?

Answers: _____, _____, and _____ (/4)

17. Statement: “You should make sure your amp is turned of before plugging in, or unplugging your instrument.”

Is that [True] or [False]? (/1)

18. What are the 4 common strings on the 6-string guitar and the 4-string bass?

Answer: _____, _____, _____, and _____ (/4)

19. Draw the neck of the guitar; with the following present: (/31)

- the frets up to the 13th (/10)

- the dots, as they appear on the neck (/10)

- the numbers of those frets (*you can choose all, or only the important ones*) (/10)

- *the strings are optonal* (--/0)

- at least 3 diferent pen colours (/1)

20. Draw the neck of the guitar again. (**using any combinaton of the previously mentoned**) (/1)

21. *Challenge:* Draw the neck of the guitar in a vertcal orientaton. (/1)
